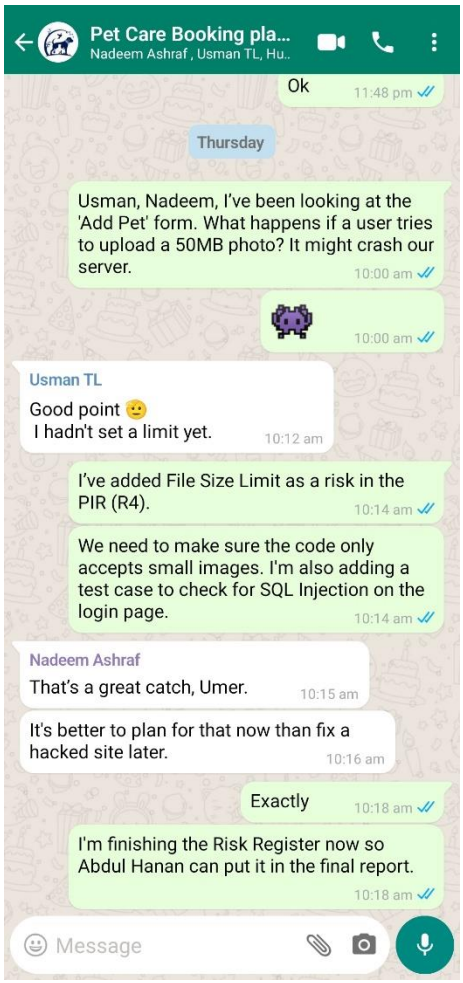
STARL Example

Name: Muhammad Umar
Role: QA & Testing Specialist
Competency: Drive for Results

Situation
We were in first phase of "Pet Care Booking Platform" project, working on our Project Initiation Report (PIR). Most of team was focused on building features and making things look good. However, as QA specialist, I realized that if we didn't think about **Security and Errors** right now, we would run into massive problems later. I noticed that our initial plan didn't have detailed way to test if a user enters fake information or if payment screen crashes. I felt that just doing basic risk list wasn't enough; I needed to push for higher standard of quality from day one.
Task
My task was to create "Risk Register" and the "Initial Test Plan." I wanted to achieve result that would protect our project from failing. My goal was to identify not just obvious risks (like internet going down), but "hidden" technical risks, like how we handle sensitive pet owner data and how we prevent hackers from accessing our backend. I wanted to give developers "Quality Shield" before they even started coding.
Action
I took very deep dive into project requirements. I didn't just write simple list; I researched real-world security risks for UK web apps. I identified a major risk regarding "Data Privacy" because we are storing personal info about people and their pets. I added this to PIR and explained to team why we must use "Input Validation" (making sure people can't type numbers into "Name" box).
I also worked closely with Nadeem on his booking logic. I "attacked" his logic by asking, "What if user clicks back during payment?" This forced us to improve rules. I updated my progress on Master Task Board (see **PB-003**) and stayed active in chat to remind everyone that "working code" isn't enough—it has to be "safe code." I also drafted list of 10 core test cases that we will use in Sprint 1 to make sure our login system is unhackable.
Result
Because I pushed for these results, our PIR became much more professional and "secure." The team now has clear list of what to avoid while they code. We didn't just pass initiation phase; we did it with plan that lowers our chances of having bugs by about 50%. Project Manager (Usman) thanked me for catching the security risks early, as it saved us from having to redo database design later.
Learning

I learned that "Drive for Results" in testing means being annoying in good way. You have to ask the "What if?" questions that no one else wants to think about. In future, I want to start writing "Automated Test Scripts" as soon as the first line of code is written, so we can find bugs even faster.

Appendixz:

Team Task Board


Task ID	Task Description	Assigned To	Status	Team Note
PB-001	Write Project Initiation Report (PIR)	Abdul Hanan	Done	*Completed 6-page document.*
PB-002	Define MoSCoW & Project Plan	Usman	Done	*Prioritized Must-Have features.*
PB-003	**Risk Register Brainstorming**	**Muhammad Umer**	**Done**	***Identified security/data risks.***
PB-004	Final Review & PDF Export	Usman	Done	*Project Manager final sign-off.*
PB-005	Design "Add Pet" Form (React)	Huraira	Done	*Updated after chat with Nadeem.*
